

## How to convert m4p to mp3

When we want to play iTunes music on non-iPod devices, the traditional way we use is to burn purchased music on CD and then rip them back. NoteBurner helps us burn iTunes music on virtual disc, not the physical one. This way may be much economical for those people who have a bunch of music purchased from iTunes store.

The way this virtual drive works is quite similar to the way a real burner does.

### Step One

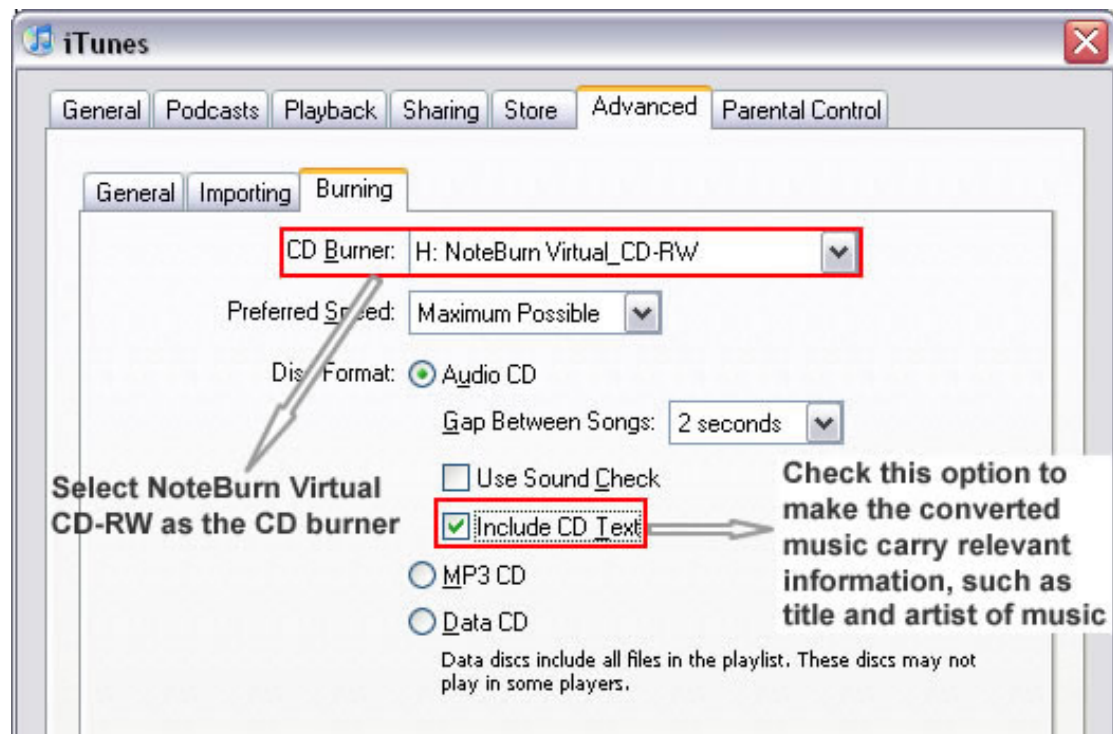

Download and install NoteBurner on the computer. The free demo is available and full version costs \$34.95. After installing this program, you will find a new CD drive is added to your computer. Normally, NoteBurner will tell you where it is located.

### Step Two

Select the output format in NoteBurner. NoteBurner is not only a virtual burner but a conversion tool, since you can choose MP3, WAV and WMA as the format which all music is burned in.

### Step Three

Run iTunes and set burner options firstly. Just as what you need to do with burning physical audio CD, you can choose Edit>Preferences>Advanced>Burning menu and then select NoteBurner Virtual CD-RW as the burner.

**Step Four**

Select the music you want to burn and add them to a newly created playlist. Batch collection is supported.

**Step Five**

Simply click Burn Disc button in iTunes to start burning selected music onto virtual disc.
